Vayle

Your sell price should do more than wait.

Vayle turns a price target for a Stock Token into a chance to earn a weekly payment.

vayle.xyz

Waiting for your price pays nothing.

You own a token tied to a stock. You know the price where you would sell. A normal limit order waits for that price, but gives you nothing while it waits.

$0

Earned by a waiting limit order

Put your price to work.

> Set the price where you would sell. A buyer can pay you for the right to buy at that price this week.

You keep the token unless the buyer uses that right after the week closes.

Three steps. One week.

01

Pick a price

Choose the token, amount, and price where you would sell.

02

Get an offer

If a buyer takes your target, you receive a payment up front.

03

Settle at close

After the week ends, the buyer may buy your tokens at your price.

No offer means no payment. Vayle also supports targets for buying with USDG.

Every target has a clear result.

Paid

A buyer takes the target. You receive the weekly payment.

Skipped

No buyer takes it. No payment, and your target carries over to next week.

Filled

The buyer acts after the close. Your tokens sell at your chosen price.

The payment is for giving the buyer a choice. It is not a promised yield.

Built for people who already have a price in mind.

FIRST USER

A Stock Token holder who would sell at a chosen price.

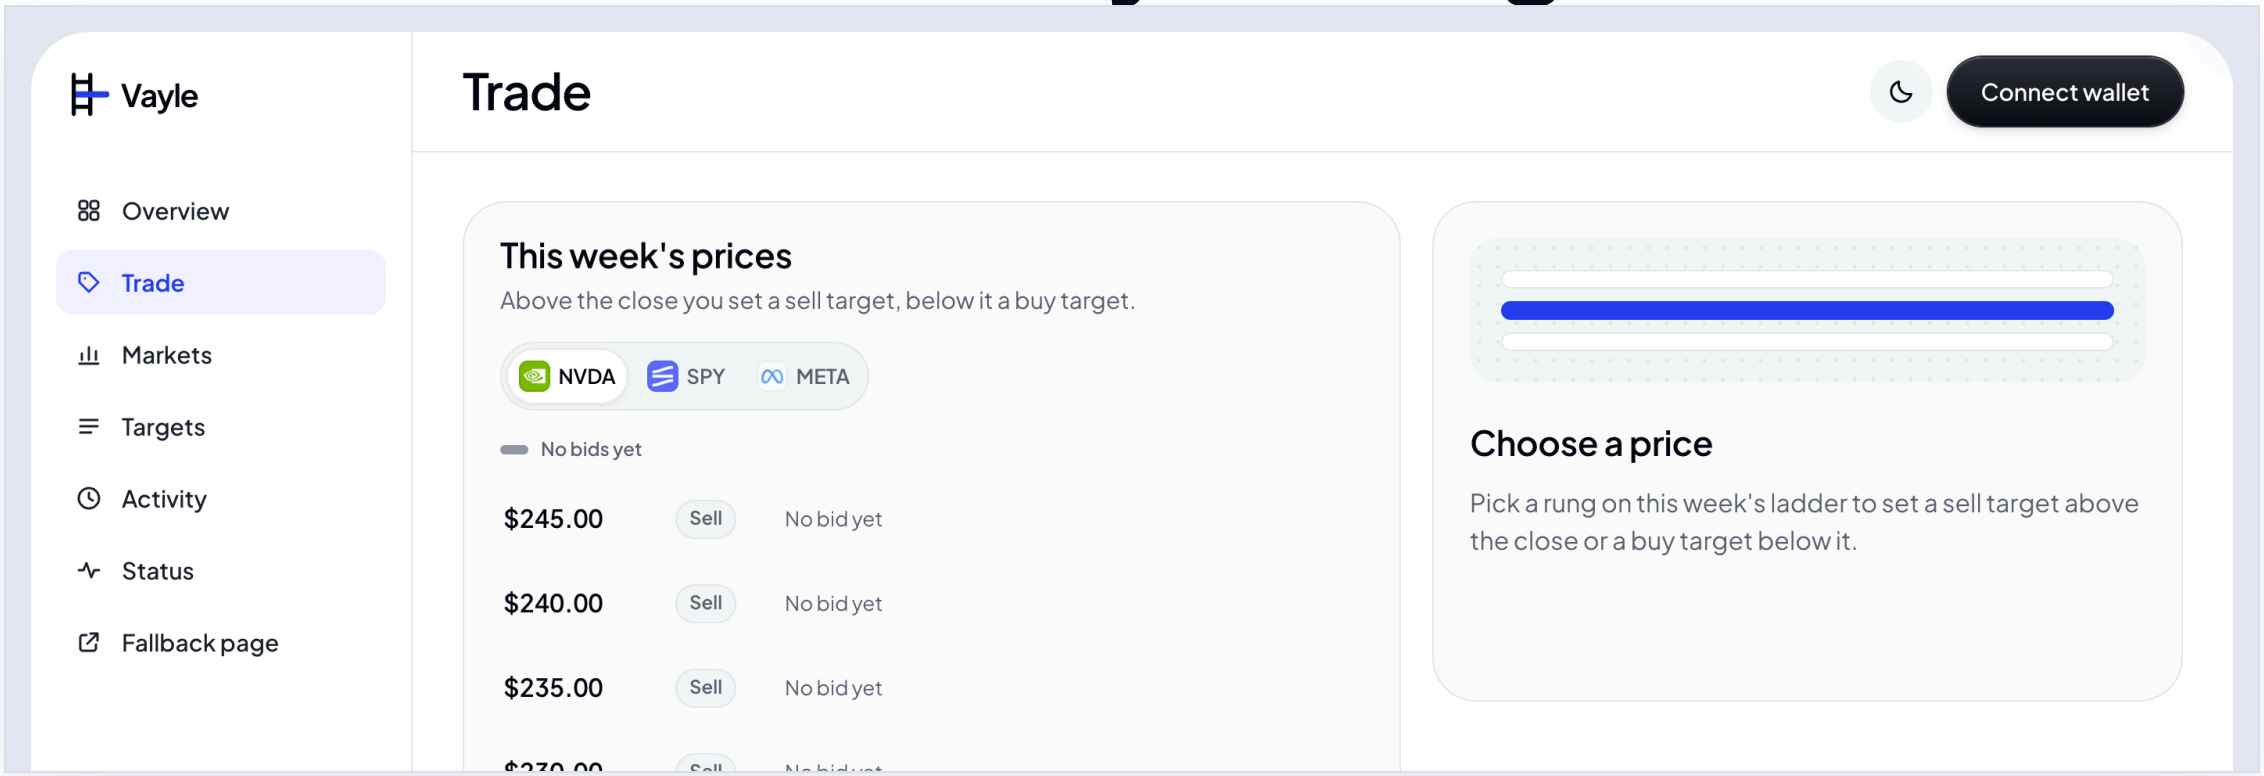

They want a simple way to set that price and see if a buyer will pay for the week.

ALSO SUPPORTED

A USDG holder who wants to buy at a chosen price.

They can set a buy target and wait for a buyer to take the other side.

Choose a market. Set your target.

Live app capture · vayle.xyz/app · October 2026

Live on chain. Small by design.

0.024372

USDG paid to the team test target

0

Outside holders so far

The first target used the team's own wallet. No token delivery had happened when these launch figures were recorded.

Source: vayle.xyz/proof and the public project repo, October 12, 2026.

Real assets back each target.

Assets are held	The seller's tokens, or the buyer's USDG, are locked before a target can go live.
Tokens move	If the buyer acts, Vayle settles with the actual Stock Token and USDG.
There is a backup	Anyone can use the public fallback path if the normal app or team service fails.

The contracts have automated tests; they have not had an outside audit.

Earn trust one market at a time.

NOW

Prove the flow

Show real targets, payments, and outcomes in public.

NEXT

Find first users

Reach Stock Token holders in Robinhood Chain communities.

THEN

Grow with care

Fund more offers, get an outside review, then add markets.

These are plans, not reported user growth.

Make money when a target gets paid.

Today: no platform fee

We keep the fee at zero while we test demand and the user experience.

Later: a small maker fee

The buyer who pays for a target could pay a fee of up to 5% of that payment. Raising it requires a time delay.

The team currently supplies the buying side. We need more capital and more buyers before this can serve many users.

A working pilot.
Now earn trust.

Our next proof is simple: an outside holder uses Vayle, understands the trade, and can verify the result.
